Earth Energies: Choosing the Right Site

J. DAVID MCAULEY

Choosing a site that avoids hazardous pollutants and then building with healthy materials are vital for creating a healthy home. The naturally occurring Earth energies, known as geopathic stress, are another important factor to consider. These energies result from polar magnetism, underground domes, veins and streams of water, radon gas emissions, electromagnetic waves, and seismic activity. Their effects can be seen in rock faults, fissures and geological stresses, power spots, vortices, mineral and ore deposits, and underground caves.
